# EXPERIMENT NO 13

Name : Adwait Shelare PRN : 25070521169

**13.1.1 Remove Punctiation from string**

**Algorithm**

**Step 1:** Start

**Step 2:** Input integer n

**Step 3:** Check if n >= 0

- If **No**, print *"Please enter a non-negative integer"* and go to Step 10
- If **Yes**, go to Step 4

**Step 4:** Call function generate_fibonacci_sequence(n)

**Step 5:** Inside function, check if n < 0

- If **Yes**, return empty list

**Step 6:** Initialize seq = [], a = 0, b = 1

**Step 7:** Repeat while a <= n

- Add a to seq
- Update values: a, b = b, a + b

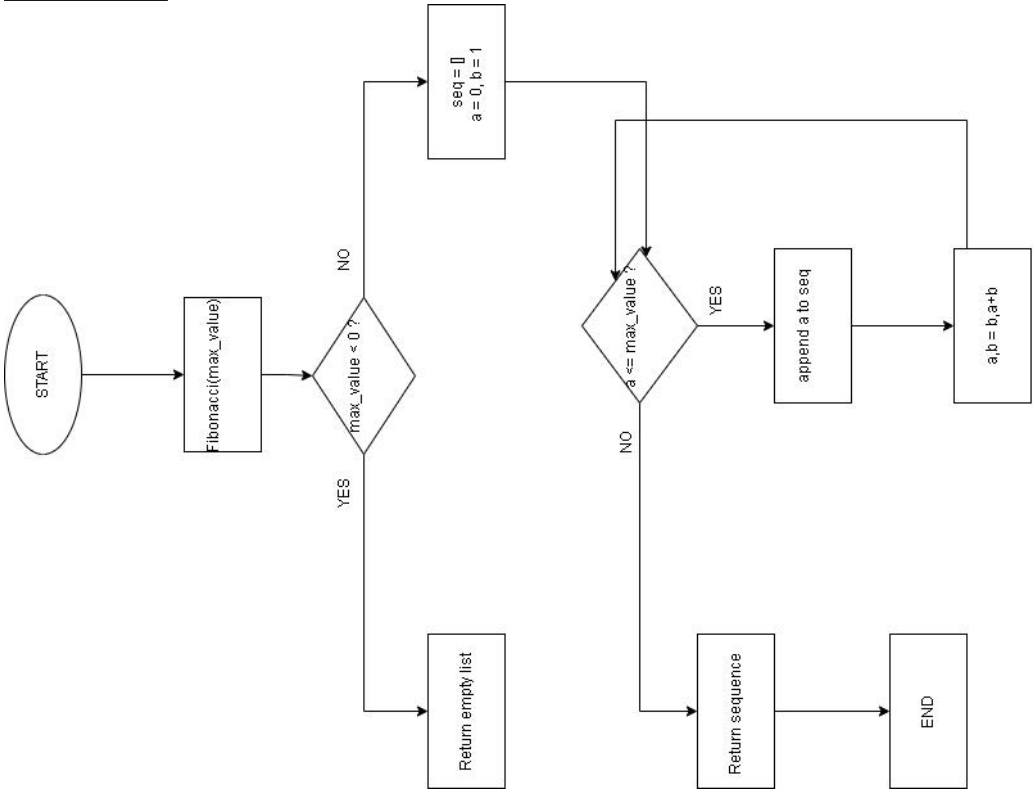
**Step 8:** Return seq to main program

**Step 9:** Print all elements of returned Fibonacci sequence

**Step 10:** End

# EXPERIMENT NO 13

## Flowchart

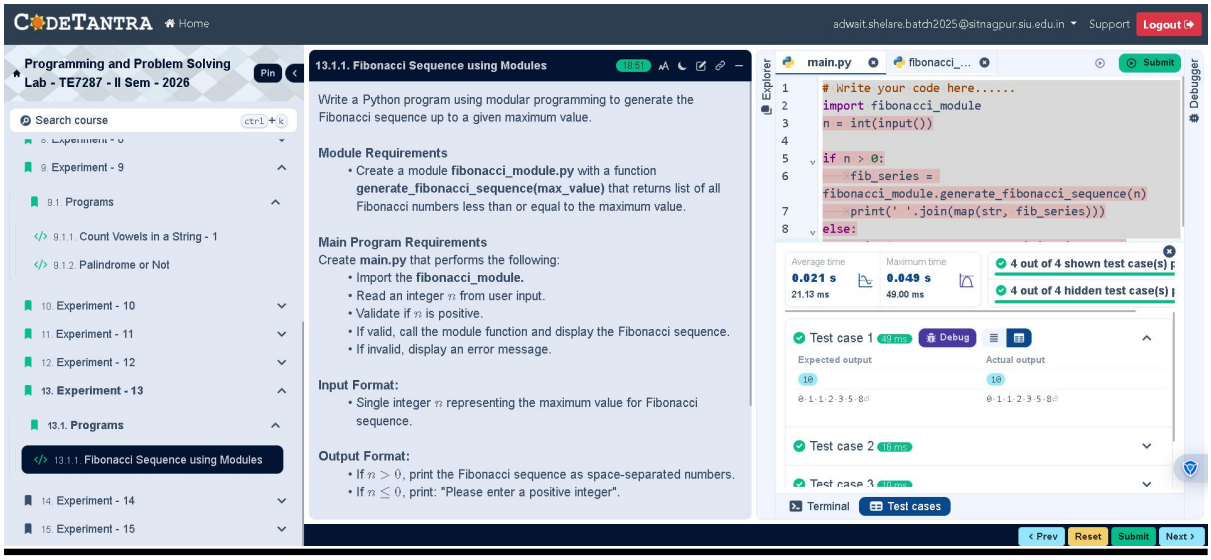


## Python code

```
# Write your code here.....
def generate_fibonacci_sequence(max_value):
    if max_value < 0:
        return []
    seq = []
    a=0
    b=1
    while a<=max_value:
        seq.append(a)
        a,b=b,a+b
    return seq
# Write your code here......
import fibonacci_module
```

# EXPERIMENT NO 13

```
n = int(input())

if n > 0:
        fib_series = fibonacci_module.generate_fibonacci_sequence(n)
        print(' '.join(map(str, fib_series)))
else:
        print("Please enter a positive integer")
```


**EXCECUTION**
